720x544 System-On-Chip Driver
For 480RGB x 272 TFT LCD

Version 1.1
Dec, 2021

1. General Description

NV3047E offers all-in-one chip solution of 480RGBx272 for color TFT-LCD panel. This chip incorporated with digital timing generator, source and gate driver, power supply circuit, PWM control circuit and embedded serial communication interface for function setting. The source output support real 8-bit resolution and 256-gray scale with small output deviation are designed to support higher color resolution. The power supply circuit incorporated with step-up circuit, regulators and operational amplifiers to generate power supply voltages to drive TFT LCD.

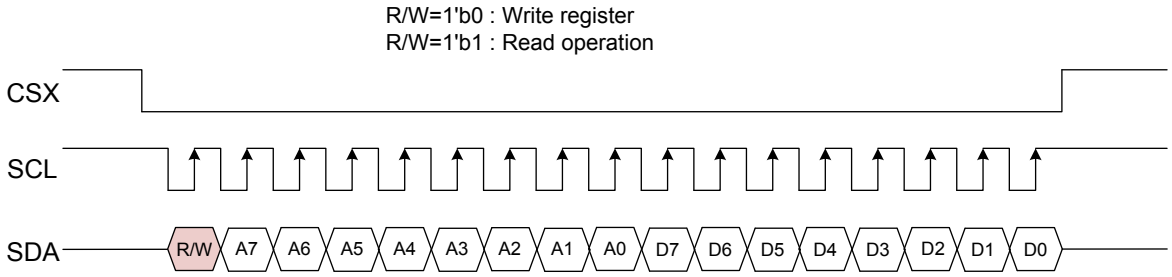
6. 3-Wire serial interface



a. Each serial command consists of 17 bits of data which is loaded one bit a time at the rising edge of serial clock SCL.

b. Command loading operation starts from the falling edge of CSX and is completed at the next rising edge of CSX.

c. The serial control block is operational after power on reset, but commands are established by the VSYNC signal. If command is transferred multiple times for the same register, the last command before the VSYNC signal is valid.

d. If less than 16 bits of SCL are input while CS is low, the transferred data is ignored.

e. If 16 bits or more of SCL are input while CS is low, the previous 16 bits of transferred data before the rising edge of CS pulse are valid data.

f. Serial block operates with the SCL clock

g. Serial data can be accepted in the power save mode.
